

METHOD FOR UPDATING A DATABASE FROM A BROWSER

ABSTRACT OF THE DISCLOSURE

Embodiments of the invention generally provide methods for updating a database in which a browser communicates changes to the database. One embodiment provides a method for updating a database, comprising: receiving a change request from a browser and executing a database update program in response to the change request. The change request may be a page redirect request from a first network address to a second network address, and the database update program replaces the first network address with the second network address in one or more data tables in the database. The change request may also be a web page change request, and the database update program is a trigger program for determining additional programs to be run to update the database.
